Jerald Zimmer, M.D.

Yours truly,

Thank you for referring this patient to us.

Images are provided.

3. Straightening thoracolumbar lordosis, which may be positional or due to spasm.

2. Mild degenerative changes.

interspace with cephalad migration.

1. Moderate sized left-sided vertically oriented L5 disc fragment which possibly arose from the L5-S1

IMPRESSION:

Disc desiccation and disc space narrowing is present at L5-S1. An ovoid vertically oriented left-sided disc fragment is present at the L5 level. The fragment measures 1.3 x 0.9 cm with a height of 1.9 cm. The fragment attains the left L4 lateral recess, coalescing with the ipsilateral L5 nerve root.

The bony canal is adequate and the bone marrow signal is normal. There is straightening of the thoracolumbar lordosis, which may be positional or due to spasm. Mild foraminal narrowing is noted bilaterally at L5-S1 and mild degenerative changes involve these facet joints and those of L4-L5.

Sagittal sequences were obtained using T1, STIR and this was followed by axial sequences using T1, T2 fat-sat extending from L5-S1 through L2-L3. The examination was performed on 1.5 T GE Excite system for left-sided radiculopathy.

MR LUMBOSACRAL SPINE

Examination of your patient reveals the following:

Dear Dr. Hochweiss,
